PROFESSIONAL SUMMARY

Fullstack Engineer specializing in the TypeScript ecosystem (NestJS, Next.js, Node.js) with deep backend and architectural expertise.

Experienced in designing scalable REST APIs, implementing secure authentication systems, optimizing database performance, and building asynchronous cloud-native workflows (GCP, Docker, Redis, BullMQ).

Focused on clean code, SOLID principles, and system resilience.

Key Impact:

- Improved API and frontend performance by 30–50% (lower latency, better TTFB)
- Reduced technical debt through refactoring and clean architecture
- Implemented secure authentication systems, eliminating vulnerabilities and bot traffic

TECHNICAL SKILLS

- **Languages & Frameworks**: TypeScript, JavaScript, Node.js, NestJS, Express, Next.js, React
- **Databases & Caching**: PostgreSQL, MongoDB, Redis, Prisma ORM
- **Architecture & Async**: Clean Architecture, SOLID, REST APIs, Microservices, BullMQ Queue System
- **Cloud & DevOps**: Google Cloud Platform (GCP), AWS S3, Cloudflare R2, Docker, CI/CD, Git/GitHub
- **Frontend & Tools**: Next.js, React Query, Zustand, Tailwind CSS, REST & Webhooks

EXPERIENCE

Fullstack Engineer (Freelance / Contract) | SimpleMarket 360 & Client Projects

May 2026 – August 2026 | Remote

- Architected and built scalable backend microservices and frontend modules using NestJS, Next.js, and PostgreSQL.
- Designed a decoupled Storage & Asset Management module using presigned URLs (S3 / Cloudflare R2) with ownership ACL and validation.
- Implemented asynchronous background processing using BullMQ + Redis to handle heavy file operations off the main request lifecycle.
- Optimized frontend data fetching and state management using React Query and Zustand, reducing redundant API requests by ~40%.
- Containerized application services with Docker and managed deployments on Google Cloud Platform (GCP)

Backend / Fullstack Engineer | NFSeek

Jan 2024 – May 2024 | Remote / Startup

- Engineered secure authentication infrastructure featuring short-lived access JWTs, persistent Refresh Token Rotation, and OAuth integrations.
- Resolved race conditions in session rehydration between Axios interceptors and frontend state, eliminating silent 401 authorization failures.
- Optimized database queries and async request orchestration, decoupling notification side-effects (Email/SMS) to reduce initial response latency by ~35%.
- Refactored monolithic backend code bases applying Clean Architecture principles and global error handling middleware.

Fullstack Developer | Independent Projects & Clients 2021 – 2023 | Argentina

- Developed custom administrative dashboards and production REST APIs using Node.js, React, and PostgreSQL for business client operations.
- Implemented third-party integrations (payment gateways, transactional email providers, maps, and geolocation services).
- Automated local development and cloud staging deployments using Docker.

FEATURED PROJECTS

Virtual Wallet API (NestJS / Node.js, PostgreSQL, Prisma, Redis, Docker)

- Built a production-ready financial backend system supporting JWT + Refresh Token rotation, custom async exception handlers, and database error mapping.
- GitHub Repository: github.com/gonzalo991/VirtualWalletAPI

EDUCATION

- Technical Degree in Programming — Universidad Tecnológica Nacional (UTN)
- Fullstack Node.js & React Developer Certifications — UTN / Telecom Digitalers
